                                                                                                                                                                                                                                   greenhouse were collected at University of California, Davis (Jan Dvorak's lab, K. Deal and E. Akhunov). Total RNA was prepared from leaves (young leaf and third leaf), whole roots, crown, steam and sheath tissues, and then equal quantities of RNA were pooled from the these samples. PolyA was purified from the pooled RNA, a cDNA library was made, and the cDNA closes were in vivo excised to give pBluescript SK(-) phagemids in J. Dvorak's lab (E. Akhunov, J. Dvorak) at the University of California, Davis. Colony plating, plasmid DNA preparations and DNA
                                                                                                                                                                              sequencing were performed in the OD other authors)."

                             S1 is a sequence of
nucleotides; and Nu
having an exocyclic
                                                   This sequence represents a primer for a fragment of HCV, and is an example of an oligonucleotide of the invention. The oligonucleotides of the invention are of the formula 5'-S1-Nu-3' or 5'-S1-Nu-S2-3', where
                 1-10C alkyl, alkoxy,
                                                                                                         Example
                                                                                                                                         Oligo-nucleotide(s)

                                                                                                         The specification describes a composition of magnetic glass particle which contain at least one magnetic object with a mean diameter between 5-500 nm. The composition is useful for the purification of nucleic acids. The composition can be used to process large quantities of nucleic acid samples, because it does not involve the particles being the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the composition of the compos
                                               nucleic acid samples, because it does not involve the particles of centrifuged or the fluids being drawn through glass fiber filters PCR primers AAHS4413-14 were used to amplify HCV DNA fragments. The amplified fragment can be purified using the method of the invention
                                                                                                                                                                                                                                                                                                                            or RNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 186 BP; 41 A; 65 C;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2-1. The 5'-UTR includes several stem-loop sequences. The antisense RA-1 is useful for inhibiting expression of HCV structural genes and thereby inhibiting viral replication in vivo. The antisense therapy can be used in addition to conventional interferon treatment of HCV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present sequence is a specifically claimed example of RNA that is complementary (i.e. antisense) to part of the 5' untranslated region of the hepatitis C virus genome sequence contained in clone

microbes and/or determination of genotype, as primers for polymerase chain reaction amplification and therapeutically for blocking replication of pathogens, e.g. as ribozymes. Particularly, the probes
                                                                                                      agents without prior DNA or RNA extraction. The probes enable detection of nucleic acids in sections of living or immobilised, frozen or fixed tissues. Probes of the invention are useful for detecting viral (including oncogenic), bacterial, animal and plant nucleic acid.
                                                                                                                                                             non-contagious molecular probes which are used for detecting nucleic acids. The process that takes account of the forms of presentation of cellular organisms during the life cycle, or where these forms depend on different chemical, biological and physical states of the organism. The process is a contamination free diagnostic method for direct quantitative and qualitative analysis and gene typing of infectious

                                 I probe complementary to at least a portion of the folded target; and CC probe /folded target and probes so that the probe hybridises to form a CC probe /folded target complex. Also provided are methods for determination CC nucleic acids targets; and for analysis of nucleic acid structure formation in nucleic acid targets; for analysing folded CC methods can be used for the detection and characterisation of nucleic acid structures. The CC acid sequences to detect the presence of pathogenic nucleic acid complex associated with disease and cancers, and the CC identification of the source of nucleic acids found in forensic samples, CC analysis of both strands (e.g. the sense and antisense strands) and are qualitative, quantitative and positional analysis. The methods are powerful in that they allow for analysis of longer analysis of nucleic acid than current methods of analysis of longer CC analysis of nucleic acid than current methods are solid support). The methods are powerful in that they allow for analysis of longer analysis of nucleic acid than current methodologies. Sequences of the methods and cancers and for high-level made and positions of analysis of longer analysis of nucleic acid than current methodologies. Sequences of comparatitis C virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial

                                                                                                                                              that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures. ABI46034 to ABI46367 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                            The present invention describes a method for identifying oligonucleotides with desired hybridisation properties to nucleic acid targets containing secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     I probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe /folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous associated with constants of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous associated with constants of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous as well as in paternity determinations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to methods and compositions of detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (i) a folded target having a DNA sequence comprising at least 1 double folded tegion and at least 1 single stranded region; and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (ii) at least stranded region and (iii) at least stranded region at least stranded region and (iii) at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded region at least stranded reg
                                                           ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences AAV/0453-61 represent partial sequences of different amplicons of hepatitis C virus (HCV) subtypes la, lb, 2c and 3a. These partial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Detection and characterisation of nucleic acid sequences - by mixing a folded target and one or more probes to form a probe/folded target complex and detecting and characterising the complexes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      WPI; 1998-610317/51.

                                                                                                                                                                                           acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles of mammallian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             03-MAR-1998;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              RESULT 11
                                                                                                that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HIV). The method allows the ability to rapidly analyse nucleic acid structures, ABI46034 to ABI46367 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Identifying oligonucleotides hybridizing to nucleic acids containing secondary structure, useful in clinical diagnosis, comprises identifying primers that interact with the target to form an extensipproduct under amplification conditions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 17-JUN-2000;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                   secondary structure. The method comprises amplifying a target nucleic acid having at least one accessible and one inaccessible site. Primers that form an extension product are identified as the oligonucleotides which can interact with the folded target nucleic acid. Oligonucleotides from the present invention can be used in novel detection methods for clinical diagnostic purposes, including the detection and identification of pathogenic organisms (e.g. HTV). The method allows the ability to rapidly analyse nucleic acid structures. ABI46034 to ABI46367 represent sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                 AAV70457 standard; DNA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               03-MAR-1998;
05-MAY-1997;
19-SEP-1997;
                                                                                                                                          of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences ANY0453-61 represent partial sequences of different amplicons of hepatitis C virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used for identifying the HCV subtypes.
                                                                                                                                                                                                                                                                                                                                                                        method of detection and characterisation comprises: (a) providing: (1) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (1) at least 1 probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe /folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysing folded nucleic acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detection and characterisation of nucleic acid sequences - by a folded target and one or more probes to form a probe/folded complex and detecting and characterising the complexes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               WPI; 1998-610317/51.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (THIR-) THIRD

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           I probe complementary to at least a portion of the folded target; and (b) mixing the target and probes so that the probe hybridises to form a probe /folded target complex. Also provided are methods for determination of structure formation in nucleic acid targets; for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or alleles sequences indicative of an infection, the presence of variants or alleles

                                                                                                                                                                                                                                                                     AAV70458
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous analysis of both strands (e.g. the sense and antisense strands) and are ideal for high-level multiplexing. The products produced are amenable to performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The invention relates to methods and compositions of detection and characterisation of nucleic acid sequences and sequence changes. One method of detection and characterisation comprises: (a) providing: (1) a folded target having a DNA sequence comprising at least 1 double stranded region and at least 1 single stranded region; and (ii) at least 1 probe complementary to at least a portion of the folded target; and (ii) at least 1 probe complementary to at least so that the probe hybridises to form a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      fragments of nucleic acid than current methodologies. Sequences AAV70453 61 represent partial sequences of different amplicons of hepatitis C virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used for identifying the HCV subtypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                03-MAR-1998;

of structure formation in nucleic acid targets; for analysing folded nucleic acids targets; and for analysis of nucleic acid structures. The methods can be used for the detection and characterisation of nucleic acid sequences to detect the presence of pathogenic nucleic acid sequences indicative of an infection, the presence of variants or allele of mammalian genes associated with disease and cancers, and the identification of the source of nucleic acids found in forensic samples, as well as in paternity determinations. The methods allow simultaneous
                        qualitative, quantitative and positional analysis. The methods may be performed in solution or in the solid phase (e.g. on a solid support). The methods are powerful in that they allow for analysis of longer fragments of nucleic acid than current methodologies. Sequences AAV70453-61 represent partial sequences of different amplicons of hepatitis C virus (HCV) subtypes 1a, 1b, 2c and 3a. These partial sequences are used for identifying the HCV subtypes.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          03-MAR-1998;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  July 10, 2003, 18:15:28; Search time 12.5213 Seconds (without alignments) 685.785 Million cell updates/sec

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
